The present invention describes gonadotropin releasing hormones (GnPH) muGnEH I (ADA88923) and muGnEH II (ADA88924), isolated from Indian Murrel (Eigh. They can be used for inducing breeding in fishes both in combination and alone by activating production of gonadotropin. The GnRH peptide muGnEH I and muGnEH II have the amino acid sequences Gln-His-Trp-Gal-Aleu-Pro-Gly (I) and Gln-His-Trp-Ser-Trp-Gly-III-Leu-Pro-Gly (II), respectively. Also described: (I) isolating and sequencing muGnEH I and muGnEH II; and (2) inducing breeding in fishes using GnEH comprisating exposing fishes to GnEH to help release gonadotropin, and inducing breeding in fishes using the gonadotropin, and inducing breeding in fishes using the gonadotropin, and the resents a GnEH amino acid sequence given in the exemplification of the
combination and alone by activating production of gonadotropin. The GnRH peptide muGnRH I and muGnRH II have the amino acid sequences Gln-His-Trp-Ser-Ala-Trp-Arg-Leu-Pro-Gly (I) and Gln-His-Trp-Ser-Trp-Gly-Ile-Leu-Pro-Gly (II), respectively. Also described: (I) isolating and sequencing muGnRH I and muGnRH II; and (2) inducing breeding in fishes using GnRH comprising exposing fishes to GnRH to help release gonadotropin, and inducing breeding in fishes using the gonadotropin. The present sequence represents a GnRH amino acid sequence given in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gonadotropin releasing hormone; GnRH; muGnRH I; muGnRH II; Indian Muzzel; fish; fish breeding; gonadotropin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          H
                                                                                                                                                                                                                                    Length 10;

```
Regulating activity of a T-cell population by providing a molecule that is capable of modifying an activity or expression level of GnRH-I or GnRH-II receptor to regulate GnRH-I or a GnRH-II mediated activity of the T-cell population.
                                                                                                                                                                                                                                    Gonadotropin releasing hormone; GnRH-I; GnRH-II; T-cell related disease; congenital immune deficiency; acquired immune deficiency; hyperreactive; psychopathology; neoplastic disease; autoimmune disease; neuroprotective; pathopsychological disease; neurological disease; allograft rejection; graft-versus-host disease; allograft rejection; cytostatic; anti-HIV; allergic; gene therapy; pejerrey.
                                                                                                                                                                                                                  Pejerrey gonadotropin releasing hormone (pjGnRH) peptide.

The invention relates to a method for regulating activity of a T-cell population. The method comprising providing to the T-cell population a molecule that is selected to be capable of modifying an activity or expression level of a gonadotropin releasing hormone (GnRH)-I or a GnRH-II mediated activity of a T-cell population. The method is useful for treating or preventing a T-cell population. The method is useful for treating or preventing a T-cell related disease or condition characterised by abnormal T-cell activity, e.g. congenital immune deficiencies, acquired immune deficiencies, infection, psychopathology or neoplastic disease, autoimmune, allergic, hyperreactive, pathopsychological and neurological diseases and conditions, graft-versus-host disease, or allograft rejections. The invention is useful in gene therapy. The present sequence is herring conditions of the conditions o

The method comprising providing to the T-cell population a molecule that is selected to be capable of modifying an activity or expression level of a gonadortropin releasing hormone (GRRH)-I or a GRH-II receptor to regulate GRRH-I or a GRRH-II mediated activity of a T-cell population. The method is useful for treating or preventing a T-cell related disease or condition characterised by abnormal T-cell activity, e.g. congenital immune deficiencies, acquired immune deficiencies, infection, psychopathology or neoplastic disease, autoimmune, allergic, hyperreactive, pathopsychological and neurological diseases and conditions, graft-versus-host disease, or allograft rejections. The invention is useful in gene therapy. The present sequence is pejerrey gonadotropin releasing hormone (pjGnRH) peptide

The invention relates to a method for regulating activity of a T-cell population. The method comprising providing to the T-cell population a molecule that is selected to be capable of modifying an activity of expression lavel of a gonadotropin releasing hormone (GnRH)—I or a GnRH—I mediated activity of a T-cell population. The method is useful for treating or preventing a T-cell related disease or condition characterised by abnormal T-cell activity, infection, psychopathology or neoplastic disease, acquirred immune deficiencies, acquirred immune deficiencies, hyperreactive, pathopsychological and neurological diseases and conditions, graft-versus—host disease, a light rejections. The invention is useful in gene therapy. The present sequence is sea bream gonadotropin releasing hormone (sbGnRH) peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Regulating activity of a T-cell population by providing a molecule that is capable of modifying an activity or expression level of GnRH-I or GnRH-II receptor to regulate GnRH-I or a GnRH-II mediated activity of the T-

The present sequence is that of an alanine-replacement peptide of a mammalian gonadotropin releasing hormone I (GnRH-I) tandem repeat peptide (see ABB76113) The GnRH-I-tandem repeat, and alanine-replacement derivatives of it (see ABB76114-23), were dimerised and conjugated to ovalbumin. The peptides were tested for efficacy for immunocastration of pigs. High efficacy for the present L7A peptide. Preferred modified, GnRH-I moderate efficacy for the present L7A peptide. Preferred modified, GnRH-I candem peptides (see ABB76100-02) are used in vaccines to reduce testis growth and to reduce testosterore to non-detectable levels. A single dose of a claimed vaccine is effective for the immunocastration of pigs. Ovacines comprising the modified GnRH-I rendem peptides can also be used to alter the reproduction or behaviour of a mammal, e.g. to sterilise to alter the reproduction or behaviour of a mammal, e.g. to sterilise comestic animals being fattened for slaughter, and to improve meat quality in pigs. The peptide gives an immunogenic response that callows for effective discrimination between GnRH-I and GnRH-II. In the humans, immunisation against GnRH, preferably selective against either GnRH-I or GnRH-II, could be used in the treatment of prostate cancer (claimed), breast cancer and some forms of pituitary carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptide for treating prostate cancer and immunocastration, comprises modified gonadotrophin releasing hormone decapeptide sequence which allows for immunogenia response that allows for discrimination between different types of GnRH.

                                                                                                                          q
                                                                                                                                                                                                The present sequence is that of an alanine-replacement peptide of a mammalian gonadotropin releasing hormone I (GRRH-I) tandem repeat peptide (see ABB76113). The GRRH-I-tandem repeat, and alanine-replacement derivatives of it (see ABB76114-23), were dimerised and conjugated to ovalbumin. The peptides were tested for efficacy for immunocastration of pigs. High efficacy for the present YSA peptide. Preferred modified, GRRH-I candem peptides, for the present YSA peptide. Preferred modified, GRRH-I candem peptides (see ABB76100-02) are used in vaccines to reduce testis growth and to reduce testogreenene to non-detectable levels. A single dose of a claimed vaccine is effective for the immunocastration of pigs. Vaccines comprising the modified GRRH-I-tandem peptides can also be used to alter the reproduction or behaviour of a mammal, e.g. to sterilise domestic animals, to treat aggressiveness in males, to prevent or treat restlessness in male animals being fattened for slaughter, and to improve meat quality, in pigs. The peptide gives an immunogenic response that allows for effective discrimination between GRRH-I and GRRH-II. In humans, immunisation against GRRH, preferably selective against either
                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide for treating prostate cancer and immunocastration, comprises modified gonadotrophin releasing hormone decapeptide sequence which allows for immunogenic response that allows for discrimination between different types of GnRH.

The GiRH-I-tandem repeat, and alanine-replacement derivatives of it (see ABB76114-23), were dimerised and conjugated to ovalbumin. The peptides were tested for efficacy for immunocastration of pigs. High efficacy was found for SAA and GIOA GiRH-tandem peptides, with lower efficacy for the present RBA peptide. Preferred modified, GiRH-I tandem peptides (see ABB76100-02) are used in vaccines to reduce testis growth and to reduce testosterone to non-detectable levels. A single dose of a claimed vaccine is effective for the immunocastration of pigs. Vaccines comprising the modified GiRH-I-tandem peptides can also be used complete the reproduction or behaviour of a mammal, e.g. to sterilise domestic animals, to treat aggressiveness in males, to prevent or treat restlessness in male animals being fattened for slaughter, and to improve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide for treating prostate cancer and immunocastration, comprises modified gonadotrophin releasing hormone decapeptide sequence which allows for immunogenic response that allows for discrimination between
                                                                                                                                                                                                                   Gaps
GnRH-I or GnRH-II, could be used in the treatment of prostate cancer (claimed), breast cancer and some forms of pituitary carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gonadotropin releasing hormone; GnRH; vaccine; prostate cancer;

The gonadotropin releasing hormone and its analogues are prepd. by a new multistage rapid peptide synthesis method in soln, where the intermediates are not isolated. The process is rapid and gives very pure peptide quickly and using little equipment. The peptide can be used in veterinary medicine to synchronise ovulation in large animal hards, and in human medicine in the treatment of fertility disorders.                                                                                                                                                                                                                                   The claimed peptide antagonists inhibit the release of gonadotrophins and/or steroids. They are antagonistic to GRRH, inhibit ovulation, and may cause resorption of a fertilised egg if administered shortly after absorption. The peptides also have utility in male contraception, and in treatment of precoscious puberty, hormone dependent neoplasia, dysmenorrhoea and endometriosis. (Updated on 25-MAR-2003 to correct PA

This luteinising hormone releasing hormone (LHRH) agonist has either a ketomethylene or dihydroketomethylene gp. replacing the amide linkage between residues 9 and 10 in LHRH. This results in an increase in oral activity. It is useful for eg male and female contraception, treatment of preoccious puberty and endo-metriosis and treatment of breast- and prostate tumours.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The peptide was synthesized with D-amino acids. It will be useful for hypogonadotropic hypogonadal men, male infertility; precocious puberty; and mammary and prostetic carcinomas. It will also be useful for development of assay for veterinery medicine. See also AAPB1573-82. (Updated on 25-WAR-2003 to correct PA field.) (Updated on 25-WAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Decarpeptide luteinising hormone releasing hormone analogues - contain natural amino acids and have high activities for releasing luteinising hormone and FSH.
Orally active luteinising hormone-releasing hormone peptide analogues have keto:methylene or hydroxy:ethylene in place of amide between proline(9) and glycine(10).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Luteinising hormone releasing factor; follicle stimulating hormone; fertility; precocious puberty; mammary carcinoma; prostatic carcinoma.

The peptide was synthesized with D-amino acids. It will be useful for hypogonadotropic hypogonadal men, male infertility; precocious puberty; and mammary and prostatic carcinomas. It will also be useful for development of assay for veterinary medicine. See also AAP81573-82. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                    Deca:peptide luteinising hormone releasing hormone analogues - contain natural amino acids and have high activitles for releasing luteinising hormone and FSH.
                                                                           Luteinising hormone releasing factor; follicle stimulating hormone;
fertility; precocious puberty; mammary carcinoma; prostatic carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Luteinising hormone releasing factor; follicle stimulating hormone; fertility; precocious puberty; mammary carcinoma; prostatic carcinoma.

It will be useful for hypogonadotropic hypogonadal men, male infertility; precocious puberty; and mammary and prostatic carcinomas. It will also be useful for development of assay for veterinary medicine. See also AAP81573-82. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Deca:peptide luteinising hormone releasing hormone analogues - contain natural amino acids and have high activities for releasing luteinising hormone and FSH.
                                                                                                                                                                                                                                                                                                                                                                    Luteinising hormone releasing factor, follicle stimulating hormone, fertility, precocious puberty, mammary carcinoma, prostatic carcinoma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Analogues (I) of the sequence pref. have amino acid (AA) substitutions at posns. 2 (his is replaced by a D-AA) and 6 (gly is replaced by a D-AA). A therapeutically effective amt. of such an antagonist is contained in a pharmaceutical compsn. alongside a menopausal-symtom-alleviating amt. of a 19-nor progestational agent (II) (pref. both in single formulation). The compsn. is pref. administered nasally in dosages of 0.01-1 mg/kg/ day for (I) and 0.02-0.07 mg/kg/day for (II). May be used for inhibition of ovulation, and treatment of eg endometriosis, breast cancer, polypitistic ovarian disease, or precocious puberty in female mammals. (Updated on 03-0CT-2002 to add missing OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Compsn. comprising LHRH-antagonist and 19-nor-progestational agent - fc
treating female gynaecological disorders based on gonads steroid prodn.

possesses high anticoulatory and antinoplastic activity, is free of anaphylactoid side effects and is believed to be free of endematogenic effects. The peptide may be used to treat precocious puberty, hormone dependent tumours, e.g. malignant and benign prostate tumours, e.g. secondary amenorrhoea, endometriosis and ovarian and mammary cystic diseases. The peptide is also useful for regulating ovulation e.g. as precocial or postcoital contraceptives, for synchronising oestrus in livestock and for improving the "thythm" method. It is also useful for regulating the human menopausal gonadotropin, follicle stimulating and LH levels during premenopausal and postmenopausal periods. As it suppresses the spermatogenesis and testosterone levels in males, it may be of potential use for male contraception. See also AAR26818, AAR29046-7. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                    New deca:peptide luteinising hormone-releasing hormone antagonists - for treating precocious puberty, hormone dependent tumours, endometritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The decapeptides is an antagonistic analogue of hypothalamic LHRH which

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The C-terminal residue (Gly-CO-NH2) can be replaced by ethylamide. This peptide and framents of it (i.e. amino acids 4-10, 5-10, 6-10 and 7-10) are agonists and antagonists of LHRH. They are useful for treating e.g. precocious or delayed puberty, psychiatric disorders esp. those of the libido or sexual aggression, etc. In addition they are useful for functional exploration of the hypothalamus hypothyseal axis and for radioimmunological or biological assay (of LH, FSH and steroid levels) in biological fluids and biopsy samples. ```
A new method is provided for preparing a decapeptide of formula pGlu-His-Trp-Ser-Tyr-Xaa-leu-Arg-Pro-Gly-NH2, in which a protected nonapeptide corresponding to the N-terminal of the peptide is first prepared on a benzhydrylamine resin, the Pro residue being attached to the resin via a photosensitive linker. The nonapeptide is cleaved from the resin by photolysis, the C-terminal is activated, and the product is coupled with glycinamide to add the Gly-NH2. The decapeptide is then deprotected. In the decapeptide, Xaa is Gly (giving gonadorelin; the present sequence), D
                                                                                                                                                                                                                                                                            Prepn, of luteinising hormone and follicle stimulating hormone releasing peptide(s) - by cleaving a protected nona-peptide resin by photolysis to remove the support, coupling with glycinamide and deprotecting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gonadotropin releasing hormone; GnRH; gonadoliberin; reproduction; transgenic animal; transgenic fish; transgenic fowl.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New gonadotropin releasing hormone preprohormone DNA - used to oprods. for regulation of reproductive function and diagnosis of reproductive capacity and disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic immunogenic peptides are provided in which a universal immune stimulator is linked to a peptide or protein hapten containing B cell and/or cytotoxic T lymphocyte epitopes, giving a product which causes potent immune responses to the coupled peptide or protein. The stimulator consists of (A) a promiscuous helper T cell epitope (Th) which elicits an immune response to the coupled peptide in members of a heterogeneous immune response to the coupled peptide in members of a heterogeneous compulation expressing diverse HLA phenotypes, and (B) an adjuvant peptide sequence from the invasin protein of Yersinia. Spacer amino acid comains and between the immune stimulator and hapten components. When the hapten is LHRH, then optionally the invasin domain can be omitted from the immune stimulator and sequence represents an LHRH hapten which can be attached to the stimulator to provide a potent vaccine for treating e.g. prostatic hyperplasia, androgen-dependent carcinoma, prostatic carcinoma, testicular carcinoma, endometriosis, envere) premenstrual syndrome or oestrogen-dependent breast cancer, or for induction of infertility.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   a
                                                                                                                                                                                                                                                                                                                                                                     This sequence represents naturally occuring gonadotropin releasing hormone (GRRH). Analogues of GRRH are represented by AAR86946-56.

Motility disorders, including functional bowel disease, can be treated by the administration of one of the GRRH analogues shown here (e.g. production of reproductive hormones such as luteinising hormone, progesterone and relaxin. Motility disorders are caused from abnormalities of the autonomic nervous system. Due to this, the GRRH analogues are administered by injection (which may be intravenous, subcutaneous or intramuscular), or by a drug delivery system. The drug delivery system can comprise a drug implant with timed release, a nasal spray or an injection of a long-lasting depo form. This method is used to alleviate symptoms such as nausea, vomiting, abdominal pain and altered bowel habits. The sequences can be used to treat motility disorders in a wide variety of other diseases including irritable bowel syndrome, diabetes, scleroderma and Parkinson's disease. (Updated on 25-MAR-2003 to

The present invention relates to cytotoxic receptor ligand scaffolds (CRLS) of the general formula (Lys)n(Unb)m(Sol)m-(Xn)n-Z, where Unb=sterically unbindered group, Sol=hydrophilc solubilising group, n= 3-10 in = 0-5; X= receptor ligand, and Z= cytotoxin. The CRLS are used to sterilise animals, they destroy cells in the pituitary that secrete gonaderrophins. The CRLS can also be used to halt the development of tumours (e.g. breast and prostatic cancers) stimulated by steroid hormones or to treat endometriosis. These scaffolds induce efficient targeting agent, X, is almost the same as that of free ligand, and the scaffolds provide a permanent sterilisation (in both sexes) without anabolic effects Sterilisation is achieved without losing the anabolic effects of testosterone. The present sequence represents naturally occurring gonadotrophin releasing hormone (GRRH).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New cytotoxin-receptor ligand conjugate based on poly:lysine scaffold used to kill selected pituitary cells for chemical sterilisation, also for treating cancers and endometriosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                       ARR77431 is catfish gonadotropin releasing hormone (cfGnRH). It is used in a binding assay as a muan GnRH-related peptides of the invention are capable of inhibiting the proliferation of liver cancer cells. The effect of GnRH-related peptides is not caused by derived cativity, since upon treatment with the peptides, hepatomachived cell lines HepG2 and HuH-7 did not lose cellular viability (>90%). The peptides appear to cause hepatoma cells to move into a continuous cytostatic state. The peptides can be used to suppress or inhibit the growth of liver cancer cells. Since liver cancer cells have receptors with high binding affinity for GnRH and its analogues the peptides can also be useful in the diagnosis of liver cancer
                                                                                                                                                                                                                       Treating mammalian liver cancer - by administering an inhibitory amt. of

This sequence represents a luteinising hormone releasing hormone analogue. The invention relates to peptides having the following amino acid or LaZ-X3-S-X6-X7-P-X8- NH2, in which X1 = pyroglutamic acid or D-acetylnaphthylalanine; X2 = histidine or D-4-chlorophenylalanine; X3 = an amino acid derivative capable of chelating a leucine or arginine; X3 = an amino acid derivative capable of chelating a radiometal; X6 = leucine or tryptophan or tryptophan or lysine; and X8- NH2 = glycine amine or D-alanine amide. The peptides are luteinising hormone releasing hormone (LHRH) analogues that can bind radiomolides while retaining the ability to specifically bind to the LHRH receptor. They can be used for preparing radiolabelled peptides that specifically bind to cells or tissues that express LHRH receptors. The radiolabelled peptides can be used to image or treat tumours, infectious lesions, peptides can be used to image or treat tumours, infectious lesions. It issues. The radiometal chelating peptides are stable in blood and other body fluids and tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New luteinising hormone releasing hormone analogues - having an amino acid residue deriv. for chelating a radio:metal for use in diagnosis and
amino acids. The present sequence represents a luteinising hormone-releasing hormone (LHRH) analogue, containing an N-benzylglycine, N-cyclobaxylmethylglycine or a ring substituted derivative of one of these two amino acids
                                                                                                                                                                                                                                                                                                                                                                                                                                  J hormone releasing hormone; LHRH receptor; tumour; chelating peptide; diagnosis; therapy; analogue.

Novel LHRH antagonist peptides are disclosed in which the residue of the anino acid corresponding to position 6 of natural mammalian LHRH contains a hydrophilic Nacyl moiety, a dipolar moiety, a sulphonium moiety, a receptor-modifying moiety or a small polar moiety. The peptides may have reduced histamine-releasing activity and improved water solubility. They are useful for treatment of precocious puberty, prostate cancer, ovarian cancer, banign prostatic hypertrophy, endometricals, uterine fibroids, breast cancer, premenstrual syndrome, polycystic ovary syndrome and diseases which result from excesses of gonadal hormones in humans or animals. They may also be used for behaviour modification (including chemical castration), for treatment of immunosuppressed patients, or for inhibition of ovulation. The present sequence represents an additionally claimed new peptide which instead has a modification at position 8
                                                             ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New LHRH antagonist peptide(s) modified at amino acid position 6 - useful for treatment of, e.g. prostate cancer, breast cancer, endometriosis or premenstrual syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel LHRH antagonist peptides are disclosed in which the residue of the amino acid corresponding to position 6 of natural mammalian LHRH contains a hydrophilic N-acyl moiety, a dipolar moiety, a sulphonium moiety, a receptor-modifying moiety or a small polar moiety. The peptides may have reduced histamine-releasing activity and improved water solubility. They are useful for treatment of precocious puberty, prostate cancer, ovarian cancer, premenstrual spractorphy, endometriosis, uterine fibroids, breast cancer, premenstrual syndrome, polycystic ovary syndrome and diseases which result from excesses of gonadal hormones in humans or animals. They may also be used for behaviour modification (including chemical castration), for treatment of immunosuppressed patients, or for inhibition of ovulation. The present sequence represents an additionally claimed new peptide which instead has a modification at position 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New LHRH antagonist peptide(s) modified at amino acid position 6 - useful for treatment of, e.g. prostate cancer, breast cancer, endometriosis or premenstrual syndrome.

The present sequence represents a lutenizing/releasing hormone, and was used as an example as a digestion before analysis by mass spectrometry, using this novel onbe represented in a single digestion from a nine well digestion can be represented in a single digestion or it is often derived from two or more wells. The methods, apparatus and kit (claimed) can be used for the nalysis of polymers, particularly biopolymers, e.g. DNA, RNA, peptide nucleic acids, proteins, peptides and carbohydrates. It provides a rapid, automated and cost effective sequencing of polymers, with a statistical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GnHR; lytic peptide; rat; gonadotrophin-releasing hormone; contraception;

This sequence represents the rat gonadotrophin-releasing hormone (GnRH), which is used in a method for producing long-term contraception or sterility by administering GnRH, beta luteinising bromone (LHM) or lamprey clusteinising hormone-releasing hormone (L-LERH-III) or temporarily restoring fertility in a mammal in which the pituitary gonadotropes have been selectively destroyed by administration of GnRH or l-LERH-III. This convent of hormone- or ligand-dependent tumours by administering the relevant hormone- or ligand-dependent tumours by administering the relevant hormone or ligand dependent on binding of a cell-surface receptor to a crivity of which is dependent on binding of a cell-surface receptor to a ligand by administering the ligand and lytic peptide, inhibiting reproductive capacity of an insect by administration of a lytic peptide. Fusion proteins combining such proteins and lytic peptides can be fused and may also include a carrier domain, specifically vitamin B12, that facilitates intestinal uptake after oral administration. These methods control e.g. plants containing an exogenous gene encoding L-hecate. A further application is in the treatment of ovarian, breast, prostate, control e.g. plants containing an exogenous gene encoding L-hecate. A further application is in the treatment of ovarian, breast, prostate, choweverial to resticular cancers, prolactinoma, growth hormone-, theorems. In addition the proteins can be used to kill lymphocytes invested.

```

New fusion of hormone and lytic peptide for selective cell killing -particularly for controlling fertility in animals, insect pests, fish etc., also for treatment of hormone-dependent cancer, viral infections

Example 9-14; Page 42; 59pp; English.

etc., also ion creatment and auto-immune diseases.

This sequence represents a chicken gonadotrophin-releasing hormone or setzilty by administering GnRH, beta luteinising long-term contraception or starility by administering GnRH, beta luteinising hormone (IH) or temporarily restoring fertility in a mammal in which the pituitary gonadotropes have been selectively destroyed by administration of GnRH-III) or temporarily restoring fertility in a mammal in which the pituitary gonadotropes have been selectively destroyed by administration of GnRH-III. This capacity of hormone or ligand plus a lytic peptide, for killing a cell the activity of which is dependent on binding of a cell-surface receptor to a ligand plus a lytic peptide, inhibiting reproductive capacity of an insect by administration of a lytic peptide. Fusion proteins combining such proteins and lytic peptides can be fused and may also incelude a carrier domain, specifically vitamin B12, that and may also incelude a carrier domain, specifically vitamin B12, that can intestinal uptake after oral administration. These methods have applications for increasing the growth rate of mammals, for pest control e.g. plants containing an exogenous gene encoding L-hecate. A thyrotropin- or gonadotropin-dependent adenomas, or any pituitary adenome. In addition the proteins can be used to kill lymphocytes infected cells. (Updated on 17-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a mammalian inteinising hormone releasing hormone (mLHRH). A LHRH isolated from Lamprey III (1-LHRH-III) is defentical with, or very similar to, the mammalian follicle-stimulating hormone (FSH)-releasing factor, i.e. present sequence. 1-LHRH-III causes a selective change in serum FSH levels but not a proportional change in serum levels of LH (luteinising hormone). The peptide and its agonists (see AMM95/69-95) can be used to increase the level of FSH in vertebrates, and so are used to increase fertility, in males or females, particularly in humans but also in other mammals and fish. Antagonists of the peptide (see AAM96796-104) can be used to decrease the release of FSH, and so are used to decrease the release of FSH, and so are used to decrease fertility by inhibiting spermatogenesis and follicular/ovarian development

                                                The patent discloses new luteinising hormone releasing hormone (LH-RH) peptide analogues in which neopantylglycine (Npg) is substituted for Leu at position 7. A generic formula is given. The present sequence is a specific example of the new analogues. Replacement of Leu(7) in LH-RH by Npg increases the activity of LH-RH itself, and makes it possible to obtain analogues with a high affinity for the LH-RH receptor. The analogues are non-toxic at therapeutically effective doses. They we used in reproductive endocrinology and in treatment of sex hormone-dependent benign or malignant tumours. E.g. they may be used for contraception or for the treatment of infertility and prostate cancer. They may also be used for treatment of autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to method for producing long-term contraception or sterility in a mammal that comprises administering an amphipathic lytic peptide compound. The comprise: (a) a hormone domain selected from gonadocropin-releasing hormone (GRRH) and GRRH analogues, and (b) a lytic peptide domain. The compounds are relatively small and are not antigenic. Lysis of gonadocropes has been observed to be very rapid. The components - the ligand and be lytic peptide-may optionally be administered as a fusion peptide. The methods can be applied to dogs, cars, cows, bulls, pigs, horses, sheep or humans, including sexually imparate.
                                                                      Contraception; sterilitý; amphipathic; lytic peptide; hormone domain; gonadotropin-releaaing hormone; GnRH; analogue; gonadotrope; dog; cat; cow; bull; pig; horse; sheep.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                       Production of long-term contraception or sterility in, e.g. cats - ladministering a compound comprising fusion peptide of gonadotropin-releasing hormone and lytic peptide domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

This invention describes a novel fusion protein, comprising a heat shock protein (e.g. ubiquitin), fused to an epitope (s) in a defined manner which is useful for the simulation of a highly specific immune response when administered to an animal. The protein of the invention may be post translationally modified (e.g. by the addition of fatty acids to enhance immunogenicity). The fusion proteins of the invention can be used as confirmed of control of viral infections, beacterial infections, parasitic infection and cancer. The fusion proteins can be used in pharmaceutical compositions for the treatment of gastrointestinal diseases, pulmonary inflections, respiratory inflections, and HIV diseases, pulmonary inflections, respiratory inflections, and HIV diseases, pulmonary inflections, respiratory inflections, and HIV diseases in parasitic infection of anti-self immune responses. e.g. infections of anti-gonadotropin releasing hormone and follicle simulating to presentation of anti-gonadotropin releasing hormone and follicle simulating in the suppression of ulternizing hormone and follicle simulating to the treatment of prosted cancer and breast cancer. In livestock, the normone with indirectly suppresses stridogenesis and gamete maturation in the treatment of prosted cancer and breast cancer. In livestock, the ability to stimulate an anti-self response provides a simple alternative complysical castration. Immunocastration of pigs is a better alternative to physical castration. Immunocastration of pigs is a better alternative complysical castration. Immunocastration of pigs is a better alternative series as of effects associated with physical castration, as it does not result in any of the detrimental side effects associated with physical castration, and speam proteins for fertility control of allergic reactions, control. A further use of the fusion proteins is as part of a vaccine control. A further use of the fusion proteins as part of a vaccine can be used to detect and identify antibodies from experimental and d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

This invention describes a novel method for the use and preparation of cell activating compositions which involves preparing a cell activating compositions which involves preparing a cell activating composition (a) homogenizing pancreatic tissue in buffer at composition comprising (a) homogenate, (b) removing composition comprising (a) homogenate, (c) optionally incubating the resulting the bomogenate and selecting fractions that exhibit cell activation activity. The methods can be used for improving treatment of activation activity. The methods can be used for improving treatment controme or reducing risk of treatment of e.g. cardiovascular disease, inflammatory disease, trauma, autoimmune disease, arthritis, organ crejection, diabetes and diabetic complications, stroke, ischemia.

Alzheimer's disease, myocardial infarction, haemorrhagic shock, diabetic complications, stroke, ischemia.

They can be used in the vectorinary treatment of a non-human subject. Protease inhibitors can be used to lower cell activation resulting from they can be used in the vectorinary treatment of a non-human subject. Protease inhibitors can be used to lower cell activation of an elevated level of hydrogen peroxide dismutase (SOD) indicates leukroyre up regulation, An elevated level of the onset of an acute cardiovascular disorders; such a disease onset or ischemic complications. An elevated level of hydrogen peroxide in plasma or whole blood and in the presence of sop peroxide in plasma or whole blood and a low level in the presence of SOD is indicative of a chronic or inminion computed in the presence of SOD is indicated level of hydrogen peroxide in the presence of SOD is indicated level of hydrogen peroxide in plasma or whole blood and in he pervent of the onset of an acute cardiovascular disorders; such is indicative of a chronic or incurred level or i Use of cell activating compositions in developing products for diagnosis and treatment of e.g. cardiovascular, inflammatory, autoimmune or Alzheimer's disease, trauma, arthritis, organ rejection, diabetes, stroke f a chronic or immune compromised condition e.g. sepsis. New immunogenic leutenising hormone releasing hormone compositions - comprise LHRH conjugated to diphtheria toxoid and adsorbed to an ionic polysaccharide, used to inhibit reproductive function in animals.

Example; Page 30; 41pp; English.

The invention relates immunogenic composition for eliciting an immune response to luteinising hormone releasing hormone (LHRH). The composition comprises a LiRH-diphteria toxoid (DT) conjugate adsorbed to an ionic comprises a LiRH-diphteria toxoid (DT) conjugate adsorbed to an ionic polysaccharide. The LHRH-DT compositions can be used for eliciting an immune response to LHRH, for castrating an animal, for regulating osstrus cycling in a female animal or for inhibiting characteristics induced by the sexual maturation of an animal, e.g. aggression or sexual activity. They can also be used for achieving production gains in livestock, e.g. reduction or elimination of unwanted organoleptic characteristics from the meat of livestock. They can also be used for inhibiting the growth of cells which are regulated directly or indirectly by LHRH, e.g. malignant concorderal cells or hyperplastic cells. They can also be used for inhibiting pregnancy, prostate cells, malignant ovarian cells, an animal. They can also be used for inhibiting pregnancy, prostate cells, and animal. They can also be used for confinent in pregnancy, prostate enlargement, endometriosis or inflammatory responses. The LHRH compositions induce a more effective immune response against LHRH compositions induce a more effective immune response against LHRH results in prevention of the release of the chormones LH and FSH from the anterior pituitary. The present invention describes tetrahydroisoquinoline derivatives (1). (1) have endocrine, cytostatic, depilatory, gastrointestinal, analgesic and gynaecological activities, and they act as luteinising hormone releasing hormone (LHRH) antagonists. (1) are useful for the treatment of sex hormone related conditions including precocious puberty, benign prostatic hyperplasia, breast and ovarian tumours, prostate tumours, cryptorchidism, hirsuitism in women, gastric motility disorders, dysmenorthoea and andometriosis. The present sequence represents an LHRH peptide purified from porcine and human hypothalamus tissue, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New heterocyclic derivatives are luteinizing hormone releasing hormone antagonists, useful for the trearment of e.g. prostate cancer, endometriosis, precocious puberty, female hirsutism, gastric motility disorders and dysmenorrhea.
                                                                                                                                                                      Luteinising hormone releasing hormone, LHRH; human; porcine; hypothalamus; tetrahydroiscquinoline; LHRH antagonist; endocrine; cytostatic; depilatory; gastrointestinal; gynaecological; analgesic; sex hormone related condition; precocious puberty; breast cancer; benign prostatic hyperplasia; ovarian tumour; prostatic typerplasia; ovarian tumour; prostatic typerplasia; gastric motility disorder; dysmenorrhoea;

This invention describes a novel aqueous suspension of monodisperse particles on non-crosslinked, non-denatured albumin (50-5000 nm) which is stable against dissolving upon dilution with an alcohol-free aqueous medium. The method involves (a) forming an aqueous solution containing albumin and hemoglobin and (b) treating the aqueous solution with an alcohol to cause the solution to become turbid. The particles are useful as agents for in vivo administration, either of their own administration or as a vehicle for other therapeutic or diagnostic agents. The method permits the formation of albumin and hemoglobin particles in the method nanometer and micrometer size range, in a form closer to their natural form than the forms of the prior art. The particles therefore constitute amove closely controlled agent for in vivo administration, with greater asse of clearance from the body after their pariod of usefulness.

Gonddoliberin precursor - rhesus macaque (fragment)
N.Alternate names: luteinizing hormone releasing hormone
C,Species: Macaca mulatta (rhesus macaque)
C,Species: Macaca mulatta (rhesus macaque)
C,Date: O.2-Aug-1996 #sequence_revision 02-Aug-1996 #text_change 16-Jul-1999
C,Accession: 178541
R;Ma, Y.J.; Costa, M.E.; Ojeda, S.R.
Neuroendocrinology 60, 346-359, 1994
A,Title: Developmental expression of the genes encoding transforming growth factor alpha A,Reference number: 158134; MUID:95124501; PMID:7545971
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NiAlternate names: gonadotropin_releasing hormone I
C;Species: Allgator missispieneis (American alligator)
C;Species: Allgator missispieneis (American alligator)
C;Datesian: A60066

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             à
HHIDIS

Gundoliberin I precursor - sharptooth catfish

Nylternate names: gonadoliberin, catfish-type; gonadotropin-releasing hormone I (GnRH-I
NyAlternate names: gonadoliberin, catfish-type; gonadotropin-releasing hormone I (GnRH-I
N)Contains: gonadoliberin I gonadoliberin Lassociated protein form I; gonadoliberin I-
C,Species: Clarias gariapians (sharptooth catfish)
C,Species: Clarias gariapians (sharptooth catfish)
C,Species: Clarias gariapians (sharptooth catfish)
C,Species: Clarias gariapians

151423
gonadoliberin precursor - African clawed frog
gonadoliberin precursor - African clawed frog
NyAlternate names: luteinizing hormone releasing hormone
C;Species: Xenopus laevis (African clawed frog)
C;Date: 13-69-1996 #sequence_revision 13-Sep-1996 #text_change 16-Jul-1999
C;Accession: 151423
R;Hayes, W.P.; Wray, S.; Battey, J.F.
Endocrinology 134, 1835-1845, 1994
A;Title: The Frog GRRH-I gene has a mammalian-like expression pattern and conserved doma
A;Reference number: 151423
A;Reference number: 151423
A;Accession: 151423
A;Accession: 151423

Ajritle: The chemical identity of the immunoreactive LHRH-like peptide biosynthesized in A; Reference number: A90108; MUID:83126573; PMID:6760865
A; Accession: A90108
A; Molecule type: protein
A; Residues: 24-33 cTAN-A; Experimental source: placental trophoblasts
R; Lobiovitz, D.; Koch, Y; Pitzer, F.; Fridkin, M.; Dantes, A.; Baumeister, W.; Amsterda A; Title: Sequential degradation of the neuropeptide gonadotropin-releasing hormone by the A; Contents: annotation; degradation pathway of synthetic hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Aintrons: 47/3; 79/3

C.Function:
A.Description: gonadoliberin stimulates pituitary secretion of lutropin and follitropin
A.Description: gonadoliberin-associated protein may have prolactin release inhibiting activiy
C.Superfamily: gonadoliberin
C.Superfamily: gonadoliberin
C.Superfamily: gonadoliberin
C.Superfamily: gonadoliberin
F.24-92/Droduct: progonadoliberin #status predicted <PGN>
F.24-92/Product: gonadoliberin #status predicted <PGN>
F.24-33/Product: gonadoliberin #status experimental <AMI>
F.34-32/Product: gonadoliberin associated protein #status predicted <GAP>
F.34-32/Product: gonadoliberin associated protein #status predicted cGAP>
F.34-33/Modified site: pyrrolidone carboxylic acid (GlN) (in mature form) #status experiment F;33/Modified site: amidated carboxyl end (Gly) (amide in mature form from following gly)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gonadoliberin precursor - rat
NyAlternate names: gonadoliberin-associated protein (GAP); gonadotropin releasing hormon
NyAlternate names: gonadoliberin-associated protein (GAP); gonadotropin releasing hormon
NyContains: gonadoliberin; prolactin release-inhibiting factor
C;Species: Rattus norvegicus (Norway rat)
C;Species: Rattus norvegicus (Norway rat)
C;Date: 3.1-Var-1988 #sequence revision 31-Mar-1988 #text_change 18-Jun-1999

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 25

RHIDTS

GONDAGOLIPPETIN II precursor - sharptooth catfish

N.Alternate names: gonadoliberin, chicken-type; gonadotropin-releasing hormone II (GRBH-N)/chains: gonadoliberin II; gonadoliberin II associated protein

C.Species: Clarias gariepinus (sharptooth catfish)

C.Date: 30-69-1993 #sequence revision 18-Mar-1997 #text_change 18-Jun-1999

C.Accession: S45600; JC1243; S42915

R.Bogord, J.; Zandbergen, T.; Andersson, E.; Goos, H.

B.Y. Title: Isolation, characterization and expression of cDNAs encoding the catfish-type a

A; Experimental source: liver
A; Experimental source: liver
A; Note: the authors translated the codon TCC for residue 60 as Phe, CTC for residue 80 a
Glu, CAA for residue 109 as Glu, and CAG for residue 113 as Glu
C; Complex: multimeric proteinase complex; cylindrical structure is made up of four stack
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A,Description: endopeptidase; peptidylglutamyl-peptide hydrolase activity
A,Pathway: protein degradation
A,Note: constitutes the major non-lysosomal proteolytic machinery; requires covalent lin
C,Superfamily: proteasome endopeptidase complex, beta subunit
C,Keywords: ATP; hydrolase; proteasome; protein degradation; proteinase
F,1-31/Domain: propeptide #status predicted <PRO>
F,32-263/Product: multicatalytic endopeptidase complex chain N3 #status predicted <MAT>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     protessome endopeptidase complex (EC 3.4.25.1) beta-type chain N3 precursor - rat N,Alternate names: protessome beta-type chain N3; protessome chain N3 C;Species: Rattus norvegicus (Norvay rat)
C;Species: Rattus norvegicus (Norvay rat)
C;Accession: 532507; 869598
